Background. Metal-organic frameworks (MOFs) are made by linking inorganic and organic units by strong bonds (reticular synthesis). The flexibility with which the constituents' geometry, size, and functionality can be varied has led to more than 20,000 different MOFs being reported and studied within the past decade.

Fullerene chemistry is a field of organic chemistry devoted to the chemical properties of fullerenes. Research in this field is driven by the need to functionalize fullerenes and tune their properties.

Directing charge transfer: In 3,6-bis(arylethynyl)pyrrolo[3,2-b]pyrroles, synthesized through double direct alkylation of the electron-rich core, the direction of intramolecular charge transfer depends on the presence and the strength of electron-withdrawing substituents at positions 2 and 5.

Chemistry – A European Journal: Early View

Chemistry comes into play in the form of chemical probes or as compounds being evaluated as potential leads or drugs. The use of chemical probes to elucidate biology is the basis of chemical genomics.
