business and technical benchmarks on a Pentium Pro processor based system. Various architectural data are collected using a performance monitoring counter tool. Results show that the Pentium Pro processor achieves significantly lower cycles per instruction than the Pentium processor due to its out of order and speculative

Performance Characterization of the Pentium Pro Processor

The Pentium Pro processor is upgradable by a future OverDrive processor and matching voltage regulator module described in Section 8. Increasing clock frequencies and silicon density can complicate system designs. The Pentium Pro processor integrates several system components which alleviate some of the previous system burdens. The second level cache, cache controller,

1 Pentium/Pentium Pro Processor 1.1 Modes The Pentium and Pentium Pro processor has three operating modes: Real-address mode. This mode lets the processor to address "real" memory address. It can address up to 1Mbytes of memory (20-bit of address). It can also be called "unprotected" mode since operating system (such as DOS) code runs in the same mode as the user applications. Pentium and Pentium Pro processors have this mode to be compatible with early Intel processors such as 8086. The ...
