paleontology, comparative anatomy, and molecular biology to the study of primate evolution, concluding that paleontologists, cladists, and molecular systematists can learn much more working together than any one group can learn working alone.

In this chapter, we discuss the evolutionary anthropology of non-human primates in the fossil record. In the sections below, we undertake a broad review of primate origins from the time of the

evolutionary theory have always been supported by primate data, the adaptationist program (Mayr, 1983) has been of enormous heuristic value for primate behavioral research.

Evolutionary Theory and Primate Behavior

We have examined the evolution of the genes at the major human β -defensin locus and the orthologous loci in a range of other primates and mouse. For the first time these data allow us to examine selective episodes in the more recent evolutionary history of this locus as well as the ancient past. We

The complexity of selection at the major primate β

This depicts antagonistic selection pressures on female size and a trade-off for females between the ecologically optimal size of their foremothers and the larger size that made their forefathers successful.

Sexually antagonistic selection on primate size

Understanding the evolution of body size and sexual size dimorphism has been a longstanding goal in

evolutionary biology. Previous work has shown that environmental stress can constrain male-biased sexual size dimorphism at the population level, but we know little about how this might translate to geographical patterns of body size and sexual size dimorphism at the species level. Environmental ...

Body size and sexual size dimorphism in primates

The evolution of brain size and complexity in the Order Primates is widely regarded as the hallmark of primate evolutionary history. Despite their importance to understanding primate evolution, the relationship between sexual selection and brain size evolution is not well studied. With the exception of whales, primate brain evolution is unique among mammals. For primates, the evolutionary ...

Understanding the processes that have produced the biological patterns we see today is a fundamental concern of evolutionary biology. When studied at the species or higher taxonomic levels these patterns and processes fall within the domain of macroevolution.
